

Shower System

Abstract

A shower system includes a shower area defined by a shower stall or primary wall having at least one misting nozzle coupled thereto. The primary wall is enclosed by a shower stall housing or a secondary wall, whereby an air channel is defined between the shower stall and the shower stall housing. A controller directs misted air through the misting nozzle and further activates an air flow system such that misted air within the shower area flows through and is dried in the air channel.
